

**My hypothesis (crackpot theory) is that we exist in a Space Time Continuum of undertermined size and shape, as a life form "phenomena" that has evolved to a level of intelligence and self awarness such that we can peer out into that Cosmos, study the data collected by scientific instrumentation and postulate on the probability of how this all happened and where we are going. I have a simplistic dynamic hypothesis of the Space Time Continuum developed through deductive reasoning that I've worked on and updated for a life time. It's a never ending work in progress. It goes like this-**

### **The Landry Nested Universati Hypothesis**

**Imagine if you will. The spatial geometry model for this scenario I'm about to describe, exists as a relationship of internally nested units. Visualize the "Russian Dolls" nested example. My hypothesis is that the spatial relation geometry of our cosmos is based on a framework of nested polyhedra solids. Which solids? Probably the sphere. The sphere is the perfect polyhedra. It doesn't matter all that much...for my hypothesis, because the units are nested using the proportionality constant of a logarithmic spiral. **Historically**, Johannes Kepler (1571-1630) delved into both scientific and "unscientific" interests, including metaphysics during his lifetime and was aware of nested ployhedra. Kepler's *Mysterium cosmographicum*, his first book, uses nested polyhedra to explain the arrangement of our solar system. The primary thesis of the *Mysterium* is that the number and relative sizes of planetary orbits can be explained by the hypothesis that the five regular solids (the cube, tetrahedron, dodecahedron, icosahedron, octahedron), if nested inside each other in an order determined by their importance, roughly, using riation as a meter, correspond to the relative sizes of the planetary orbits.**

**My spatial system has the many dimensions of my Nested Cosmos extending inward and outward to infinity. Each dimension of the nested complex represents a Nested Universati. I have designed a simplistic graphic "picture" using the nested hexahedron (cube) for visualization purposes. See the graphic diagrams following this text.**

**To explain: I believe that the "Big Bang" was actually the moment in time when this "Nested Universati" we exist in was formed (born) when matter from a Black Hole located in the "mother" "Universati" located dimensionally above us in this nested sequence, reached critical mass and a conduit "pipeline" opened and compacted matter began flowing into this "lower" dimension and a "daughter" Universati was born. The resultant decompression phenomena **WAS** the Big Bang and the Universe we view is the result. The matter from "there" was compressed via the gravity engine of a "Black Hole" and it emerged from the conduit "here" to be "spewed" throughout the expanse of this dimensionally smaller daughter Universat .**

**What do we actually know? The Gravity factor is a "force" we can quantitative "here" but we have no idea what it is. We know that eliptical galaxies demonstrate a log spiral spatial relation, and that matter is spiraling in toward galactic centers where a gravity driven Black Hole exists. We speculate that the matter captured by the Black Hole is "trapped" and flows past an "event horizon" and nothing "escapes" including light. My question...where does IT go...if not into my crackpot theory?**

**There is earlier theory suggesting more than 3 spatial dimensions exist, the "The Kaluza-Klien Theory" (Oscar Klein 1926). My graphic "picture" is more simplistic but also more eloquent. Matter "falling" into a black hole passes an "event" horizon and "disappears". Even light cannot escape the extreme gravitational force. Well...I mulled on this for years and years before I finally had the epiphany of the conduit concept and the Nested Universati as layers in the entropy phenomena of matter. I believe, when The Black Hole gravitational engine reaches a critical**

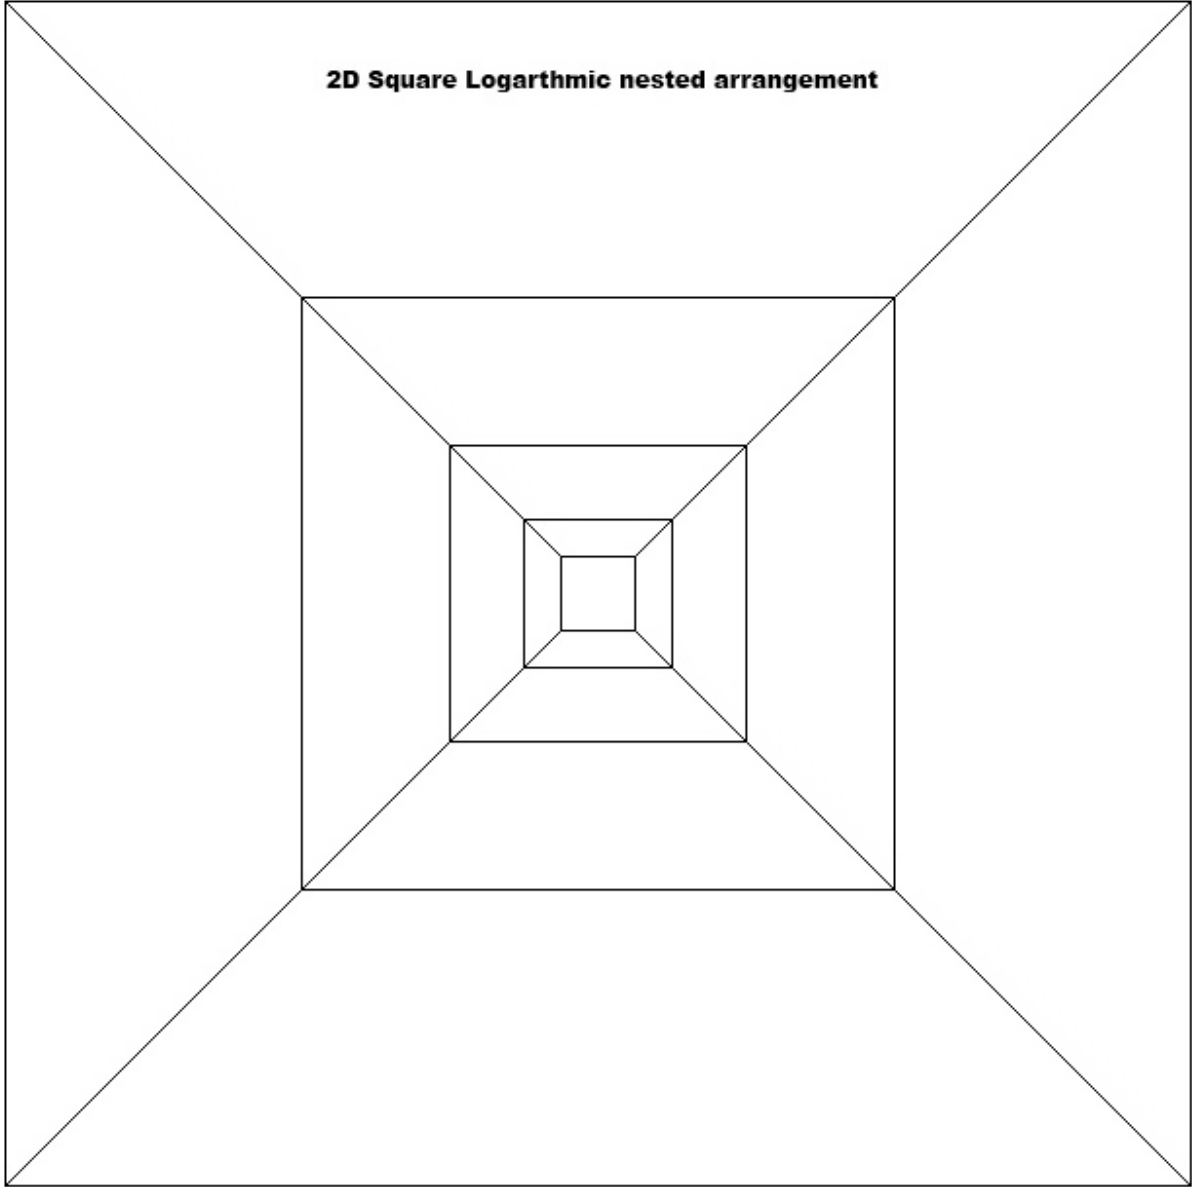

**mass level...the matter going into the event horizon....is dimensional compacted and then passes "down" the conduit to a lower dimension Universati. Some basic physical change specific to elemental atomic structure must occur during the phenomena...weak force, strong force...distance between units...something is "shrunk" but yet the same laws of Physics apply.**

**Evidence to support my layman crackpot hypothesis is simply that cosmologists have observed large galaxies and via measurements of X-ray emissions their conjecture is that a Black Hole exists at the center. My deduced hypothesis is that....The Black hole is a "rabbit hole" to a lower dimension Nested Universati....and the site where the rabbit hole opens and matter flows OUT.....that is/was ground zero for the Big Bang and the subsequent expansion phenomena.**

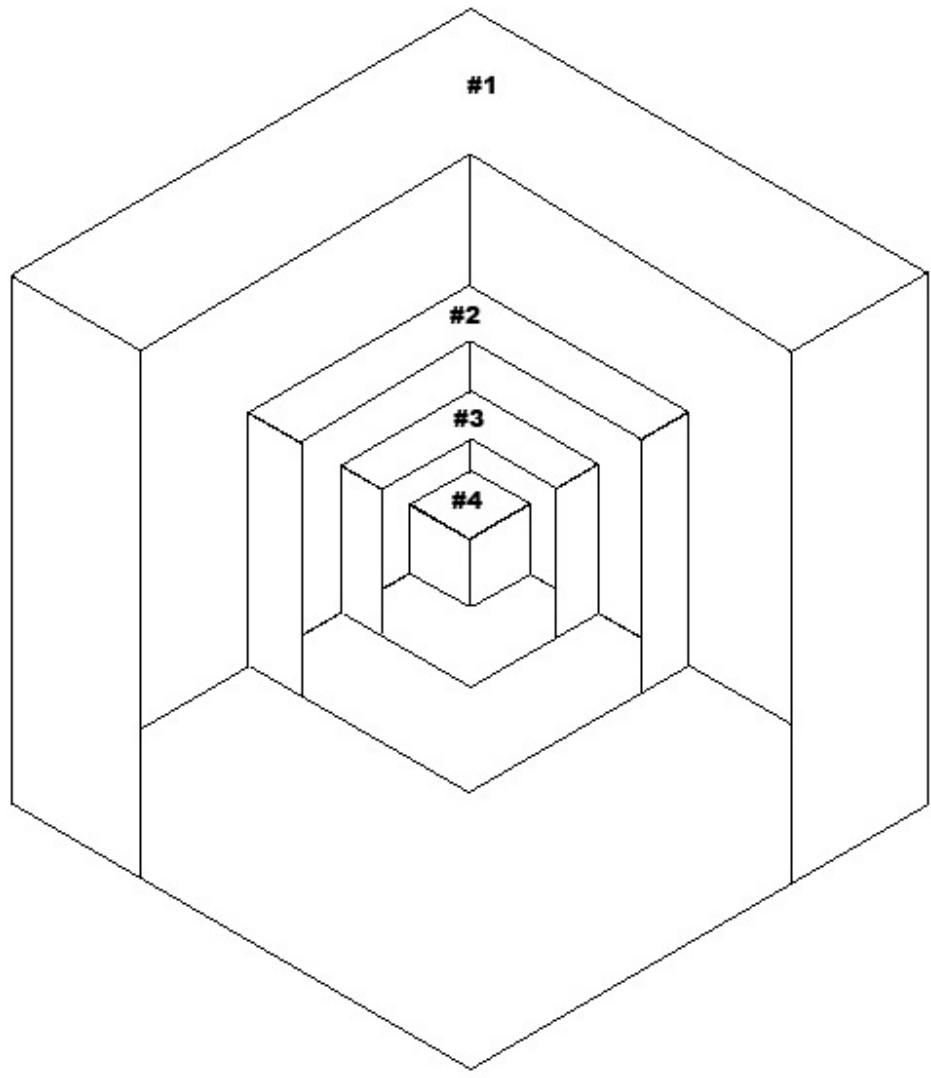

**To recapitulate: The phenomena, as I view it is: matter from a higher level Nested Universati flows "down" into a lower level (entropy in action) via a Black Hole conduit and emerges via a "Big Bang" phenomena as a "new" universe in a smaller dimension. Then the process repeats itself, over and over. In my model entropy will exist when all the matter has flowed from the highest level...to the lowest level. After that...?**
